Evaluation

Competitiors Evaluated:

- Twilio Engagement Cloud
- Plivo
- Whispir

In Terms of (innovative communication channels):

1) What do our competitors surpass us in?
2) How can we improve from our competitors?
3) What stands out about our competitors' webpages? Why?
4) How can Infobip communicate in a more innovative way?

Focusing on:

Usability Heuristics for User Interface Design
Usability Testing
Comparison & Analysis

Twilio Engagement Cloud

Introduction:

Twilio delivers real-time customer data within the UI, removing data team dependencies and empowering marketers to design engagement strategies across all channels and integrations from a single platform.

In Comparison to Infobip:

Visibility of system status:
When hovering over buttons on Twilio's website, there is an animation indicating the action, where on Infobip's website the buttons are static.
Match between system and the real world:
Twilio uses clear and concise sentences to illustrate what they stand for, where Infobip's content isn't as polished and easy to read.
Aesthetic and minimalist design:
Infobip uses a more modern and innovative design approach than Twilio. Twilio's color scheme might be easier to follow but Infobip's design is more engaging.
Infobip's website is also more optimised than the Twilio one(especially the footer section of the website).

Whilst using both websites it was apparent Infobip's website was easier to follow design and graphics wise but the content on the other hand wasn't.

Plivo

Introduction:

Plivo is a leading cloud communication platform that offers a simple, fast, and scalable way for companies to modernize their business communications. Companies of all types use Plivo's API's and SDK's to quickly integrate voice and SMS capabilities into their applications.

In Comparison to Infobip:

Visibility of system status:
When hovering over certain sections of the website, there is an animation indicating the action and providing feedback to the user, where on Infobip's website the buttons are static.
Match between system and the real world:
Familiar words, phrases, and concepts are used throughout rather than system-oriented terms, where Infobip's content isn't as successful in doing the same.
Consistency and Standards:
Plivio's web design upkeeps its external consistency and standards, using a horizontal nav bar, showcasing its partners and what it stands for. Everything is where a user would think it should be from previous user experience.

Whilst using both websites it was apparent that both Infobip and Plivo used thoughtful design techniques but Plivo's website consists of more content on some sections than Infobip.

Whispir

Introduction:

Whispir is an all-in-one communications platform designed to help businesses and organizations communicate more humanly with their team and their customers. Whispir's capabilities include a wide range of intelligent messaging solutions, from SMS to email, voice, video, social, and more.

In Comparison to Infobip:

Visibility of system status:
When hovering over buttons on Whispir's website, there is an animation indicating the action, where on Infobip's website the buttons are static.
Consistency and Standards:
External consistency and standards are being upkept by using the same colour pallet and similar section design. A downside might be that the website looks monotone and gets hard for the user to keep up with the information presented. Infobip surpasses Whispir in this aspect as the design is much easier to follow.
Aesthetic and minimalist design:
Whispir uses an aesthetic and minimalist design throughout. A high signal to noise ratio is used and the content presented seems to be relevant and concise.

Whilst using both websites it was apparent Infobip's website was easier to follow design and graphics.

Usability Testing

User Test:

I have asked a user to blind test the accessibility of each of the websites and to point out what stands out the most from each.

Feedback Received

Plivo:

- The contact sales button is used a lot throughout the website
- The log in button was hard to spot

Twillo:

- Talk to an expert seems like a useful feature
- There is an animation as you scroll down the page

Whispir:

- An interesting feature is the ability to select the location of your business
- The 'accept cookies' popup was very bothersome as it was in the way of the headers
- The website colour scheme seemed very dark and gloomy

Infobip:

- Very responsive website design with a vibrant and eye catching colour scheme
- The collapsible navbar gives the website a fresh and new feel while browsing
- The "infobip advantage" section with all the advantages should be swapped with the news strip.
- Featured partners and reviews seemed very intriguing and impressive (such as Uber).

Reflecting

1) What do our competitors surpass us in?

- All of the competitors indicated their system status better, by animating certain actions on their website.
- Content and information on Infobip's website is not as concise and easy to follow compared to its competitors.
- The web design is more throughout out in Plivio's case.

2) How can we improve from our competitors?

- Animating buttons and certain sections of the website when triggered will improve the visibility of its system status.
- Working on a better approach when adding content and information onto the website would improve its design and match between system and the real world.
- Adding more content would improve Infobip's online presence by providing a better picture on what the company stands for.
- Switching some of the sections of the website around to better company image eg. switching the news portions of the website lower down the page or including a message banner at the top of the page instead.
- Also, moving the login/signup options at the top of the page above the navbar would also be useful for returning users.
- Shortening the URL of the website would make accessing the website easier (only www.infobip.com would be used for main page home).

Reflecting

3) What stands out about our competitors’ webpages? Why?

- Twilio's website stands out the most as it uses the most creative design approach. It is focused both on showcasing the platforms abilities but also getting in contact with potential partnets.
- Plivio's website is mostly oriented on the potential customers contacting the sales department, getting new partners. Their design stands out as it' simple and concise. The content is easy to follow, hence engaging.
- Whispir's website is more focused on showcasing its platforms capabilities. Good design practices might be used but the design is too similar and feels repetitive making it less engaging.

4) How can Infobip communicate in a more innovative way?

- Animating buttons and certain sections of the website when triggered will improve the visibility of its system status.
- Working on a better approach when adding content and information onto the website would improve its design and match between system and the real world.
- Adding more content would improve Infobip's online presence by providing a better picture on what the company stands for.
- Be active on social media platform and the blog.

SWOT Analisys

Internal

Positive

Negative

S

- Modern and minimalistic design approach
- Innovative design techniques used
- Includes only relevant company information

W

- Might be costly to do considering the staff involved
- It might be tricky to deliver and cause problems

O

- Optimise the current website for responsiveness and built-in feedback
- Attract a larger targeted audience
- SEO focus can help drive a great amount of traffic

T

- Might draw less attention to the business and affect future partners
- Might not covey the companies message, values and services well enough with the currently presented content
